

Tryngolza[®]
(olezarsen) 80 mg
injection

Could your patient have familial chylomicronemia syndrome (FCS)?

Learn about key clinical features and
tools to support your diagnosis

INDICATION

TRYNGOLZA (olezarsen) is indicated as an adjunct to diet to reduce triglycerides in adults with familial chylomicronemia syndrome (FCS).

SELECT IMPORTANT SAFETY INFORMATION

CONTRAINDICATIONS

TRYNGOLZA is contraindicated in patients with a history of serious hypersensitivity to TRYNGOLZA or any of the excipients in TRYNGOLZA. Hypersensitivity reactions requiring medical treatment have occurred.

Please see Important Safety Information throughout and full [Prescribing Information](#) for TRYNGOLZA.

FCS vs MCS: critical distinctions

Familial chylomicronemia syndrome (FCS) and multifactorial chylomicronemia syndrome (MCS) are both genetic forms of severe hypertriglyceridemia (sHTG) characterized by fasting triglyceride levels ≥ 880 mg/dL, but there are several key features that distinguish them from each other.¹

Clinical/genetic feature	FCS	MCS
 Triglyceride levels	Persistently >880 mg/dL ²	Transiently or variable >880 mg/dL ²
 Population frequency	1-13 per 1 million people ^{3,4}	Up to 4000 per 1 million people ⁵
 Genetic basis	Can be monogenic ⁵	Polygenic ⁵
 Age of onset	Often younger (childhood/adolescence) ^{1,6}	Often older (mostly adulthood) ¹
 Body weight	Often within normal body mass index (BMI) range ⁵	Often overweight (BMI between 28 and 30 kg/m ²) ⁵
 Secondary factors	Less likely (except pregnancy/hormonal birth control) ²	Likely (metabolic syndrome) ²
 Response to pharmacologic treatment	Minimal to no effect (fibrates, niacin, omega-3 fatty acids, and statins) ⁷	Variable response (omega-3 fatty acids and niacin) ⁷

Consider using validated scoring criteria to aid in a clinical diagnosis or to support a diagnosis of FCS with either indeterminate or positive genetic test results.^{2,8}

Please note that not all genetic variants associated with FCS have been identified. So, even with indeterminate results, genetic testing can be supportive of a clinical FCS diagnosis.²

Please see Important Safety Information throughout and full Prescribing Information for TRYNGOLZA.

Using the North American FCS (NAFCS) scoring criteria to confer a clinical diagnosis

Its rarity and overlapping features with MCS can make FCS difficult to diagnose. In 2024, the North American FCS (NAFCS) scoring criteria were developed and validated specifically in North American patients to facilitate a diagnosis of FCS.⁸

Use the NAFCS scoring tool on the next page, along with the included secondary factors chart, to help distinguish FCS from MCS in your patients and facilitate a clinical diagnosis of FCS. A clinical FCS diagnosis may help in cases where genetic testing results are indeterminate.⁸

Use the NAFCS scoring tool for your patients

FCS=familial chylomicronemia syndrome; MCS=multifactorial chylomicronemia syndrome.

Please see Important Safety Information throughout and full Prescribing Information for TRYNGOLZA.

Calculate a score for FCS⁸

This calculator, adapted from Hegele et al, should be used in patients ≥ 1 year old with hypertriglyceridemia (≥ 440 mg/dL). In patients ≥ 10 years old, the calculator is intended for patients who are not responsive to fibrates and high-dose omega-3 fatty acids even when the patient is adherent to therapy (ie, triglycerides do not decrease by 20% or more from these treatments and do not remain reduced).

Characteristic*	Patient data	Category score
<p>Current age (years)</p> <p><input type="text" value="<†"/> <input type="text" value="≥1-9 [+12]"/> <input type="text" value="≥10"/></p> <p>↓ Hypertriglyceridemia onset (years) ↓ Only asked of patients ≥ 10</p> <p><input type="text" value="<10 [+12]"/> <input type="text" value="≥10 [+0]"/></p>		+
<p>Body mass index (percentile for children/adolescents)</p> <p><input type="text" value="<25 kg/m<sup>2</sup> or <85th percentile [+9]"/> <input type="text" value="≥25 kg/m<sup>2</sup> or ≥85th percentile [+0]"/></p>		+
<p>History of pancreatitis</p> <p><input type="text" value="Pancreatitis [+16]"/> <input type="text" value="Abdominal pain but no pancreatitis [+9]"/> <input type="text" value="Neither abdominal pain nor pancreatitis [+0]"/></p>		+
<p>Presence of secondary factors that may contribute to hypertriglyceridemia[‡]</p> <p><input type="text" value="None [+11]"/> <input type="text" value="≥1 [+0]"/></p>		+
<p>Laboratory values (select if true)</p> <p><input type="text" value="All triglycerides >880 mg/dL [+13]"/> <input type="text" value="Ratio triglycerides/total cholesterol >8 mg/dL [+8]"/> <input type="text" value="Apolipoprotein B (apoB) <1.0 g/L [+12]"/></p>		+
<p>Additional points added:</p> <p><input type="text" value="If patient is ≥1-9 years old AND has no secondary factors [+7]"/></p> <p><input type="text" value="If triglycerides/total cholesterol >8 mg/dL AND apoB <1.0 g/L [+7]"/></p> <p><input type="text" value="If triglycerides/total cholesterol >8 mg/dL AND has no secondary factors [+5]"/></p>		+
<p>Interpreting results⁸</p> <p>≥60 strongly indicates definite FCS</p> <p>≥45-59 suggests likely FCS rather than MCS</p> <p>≥30-44 suggests patient may have FCS and genetic testing should be considered⁸</p> <p><30 deemed unlikely to be FCS, but genetic testing may still be needed</p>	Result	=

Adapted from Hegele RA, Ahmad Z, Ashraf A, et al. Development and validation of clinical criteria to identify familial chylomicronemia syndrome (FCS) in North America. *J Clin Lipidol.* 2025;19(1):83-94.

*The NAFCS Score does not provide a value for pregnant patients.⁸

[†]Calculator cannot be used for patients <1 year old. If infant presents with no secondary factors that may contribute to hypertriglyceridemia, consider a diagnosis of FCS. If infant presents with ≥ 1 secondary factor that may contribute to hypertriglyceridemia, but with 2 triglyceride readings > 880 mg/dL and unexplained failure to thrive, consider a diagnosis of FCS.⁸

[‡]See table on page 7 for secondary factors that may contribute to hypertriglyceridemia.

⁸Further research is needed to determine the validity of a score from 30-44.⁸

FCS=familial chylomicronemia syndrome; MCS=multifactorial chylomicronemia syndrome.

Using the Moulin et al scoring criteria to confer a clinical diagnosis

In 2018, a panel of European experts published an algorithm-based diagnostic tool to help identify FCS in clinical practice. This FCS score is composed of the following features needed for diagnosis: severe elevation of fasting TGs, minimal response to standard TG-lowering therapies, a young age at onset, the lack of secondary factors, and a history of acute pancreatitis.²

Use the Moulin et al scoring tool on the next page to help distinguish FCS from MCS in your patients and facilitate a clinical diagnosis of FCS. A clinical FCS diagnosis may help in cases where genetic testing results are indeterminate.²

Use the Moulin et al scoring tool for your patients

FCS=familial chylomicronemia syndrome; MCS=multifactorial chylomicronemia syndrome; TG=triglyceride.

Please see Important Safety Information throughout and full Prescribing Information for TRYNGOLZA.

Identify FCS in your patients²

Use the scoring tool below to assess your patient for FCS. Follow the “Yes/No” prompts and add category scores to determine your patient’s FCS score. The numbers in parentheses represent the weighting given to the presence of each characteristic.

Characteristic	Select if applicable	Category score
Triglycerides		
Fasting triglycerides (TGs) >880 mg/dL for 3 consecutive blood analyses* (+5)		+
Fasting TGs of >1770 mg/dL at least once (+1)		+
Previous TGs <177 mg/dL at least once (-5)		+
Medical history		
No secondary factor (except pregnancy and ethinylestradiol) (+2) Secondary factors include alcohol, diabetes, metabolic syndrome, hypothyroidism, corticotherapy, and additional drugs. If diagnosis is made during pregnancy, a second assessment is necessary to confirm diagnosis post partum.		+
History of pancreatitis (+1)		+
Unexplained recurrent abdominal pain (+1)		+
No history of familial combined hyperlipidemia (+1)		+
No response (TG decrease <20%) to hypolipidemic treatment (+1)		+
Onset of symptoms at age: <40 years (+1) <20 years (+2) <10 years (+3)		+
		=
Interpreting results² ≥10: FCS very likely ≤9: FCS unlikely ≤8: FCS very unlikely		Result

Adapted from Moulin et al. *Atherosclerosis*. 2018;275:265–272.

*Plasma TG concentration measured at least 1 month apart. Eruptive xanthomas may be used as a surrogate for high TG levels (rare).²

FCS=familial chylomicronemia syndrome.

SELECT IMPORTANT SAFETY INFORMATION

WARNINGS AND PRECAUTIONS

Hypersensitivity Reactions

Hypersensitivity reactions (including symptoms of bronchospasm, diffuse erythema, facial swelling, urticaria, chills, and myalgias) have been reported in patients treated with TRYNGOLZA. Advise patients on the signs and symptoms of hypersensitivity reactions and instruct patients to promptly seek medical attention and discontinue use of TRYNGOLZA if hypersensitivity reactions occur.

ADVERSE REACTIONS

Most common adverse reactions (incidence >5% of TRYNGOLZA-treated patients and >3% higher frequency than placebo) were injection site reactions, decreased platelet count, and arthralgia.

INDICATION

TRYNGOLZA (olezarsen) is indicated as an adjunct to diet to reduce triglycerides in adults with familial chylomicronemia syndrome (FCS).

Please see full [Prescribing Information for TRYNGOLZA](#).
